Recap

Predict before you see the result

Vine and Wilson (2010) trained novice golfers either technically (group 1) or both technically and with an added quiet eye routine (group 2), then tested them under low and high pressure.

Ducrocq and colleagues (2017) gave tennis players about three weeks of an adaptive working memory task on a computer.

Symptoms, ACT hypotheses, and interventions

For each symptom on screen, decide which ACT hypothesis it points to and which intervention targets it.

Your own skeleton

Sketch how an argument from attentional control theory would run, while the material is in front of you.

Anything unclear
